1. Scope

1.1 Overview of the system

The Dobi Demo Laundry Management System is a website used to manage laundry business operations. The system can be used for user login, managing customer information, handling orders, checking laundry progress, processing payments, and managing branch information.

2. Formal Test Description

2.1 [FR-100] User must be able to manage customers.

The Customer Management Module in the '**DobiDemo**' system enables users to handle client accounts, ensuring smooth coordination of customer-facing workflows. This component is essential for registering new clients, reviewing user profiles, modifying records, and keeping customer data accurate while monitoring related loyalty points, transaction histories, and outstanding balances.

1. **Test Scenario [TS05]:** Concentrates on verifying the system's capacity to execute core customer administration features.
2. **Test Cases [TC01-TC05]:** Verify the individual capabilities of the Customer Management Module, such as creating new customer profiles, browsing the client registry, searching for specific individuals, reviewing detailed account summaries, and editing current customer information.

2.1.1. [FR-101] Add new customer

Test case design technique	:	Decision Table Testing
Explanation	:	Determine and evaluate varied groupings of inputs and system actions, such as inputting customer names, contact numbers, descriptions, and initial account balances with both correct and incorrect data inputs depending on system logic.

Test Case ID	TS01-TC01
Test Case Name	Add a new customer with name, phone number, description and starting balance (if any)
Pre-Conditions	1. User must logged in into the system 2. User must be in the Customer module
Test Procedures	1. Click “+” button on the navigation bar 2. Click the Customer module on the drop down menu 3. Enter the customer’s details 4. Click the add button on the bottom 5. Registration successful
Test Input	Expected Output

Name : Umairah, Phone : 01136651302, Balance : 0	Customer successfully added
Phone: 123ABC	System rejects the input
Name: "", Phone: 0131234567	Validation error

Table 1: Test Case for Add New Customer

2.1.2. [FR-102] View, sort, and search customer list.

Test case design technique	:	State Transition + Decision Table Testing
Explanation	:	Determine and evaluate varied groupings of inputs and system actions, such as sorting the customer directory or filtering accounts via specific user query strings with both correct and incorrect data inputs depending on system logic.

Test Case ID	TS01-TC02
Test Case Name	View a list of customers, sort them according to Name, category or Account Balance and search for customers by name
Pre-Conditions	1. User must logged in into the system 2. User must be in the Customer module
Test Procedures	1. Click “↑↓” on Balance column , click one more time to descend the data 2. Click sort on Name column 3. Click sort on Category 4. Use search box and type keyword
Test Input	Expected Output
Sort descending	Customers sorted correctly
Keyword: Unknown	"No customer found" displayed

Table 2: Test Case for View, Sort, and Search Customer List

2.1.3. [FR-103] View customer details and sales history.

Test case design technique	:	State Transition + Decision Table
Explanation	:	Determine and evaluate varied groupings of inputs and system actions, such as opening individual profile summaries, verifying contact records, and tracking transaction records with both correct and incorrect data inputs depending on system logic.

Test Case ID	TS01-TC03
Test Case Name	View customer details including name, phone number, category, description, and current account balance. The system must be able to show all sales related to the customer.
Pre-Conditions	1. Customer must be exist
Test Procedures	1. Click on the customer's name 2. View the details
Test Input	Expected Output
Customer ID: 2	Customer info and sales history displayed

Table 3: Test Case for View Customer Details and Sales History

2.1.4. [FR-104] Categorizing customers by sales volume.

Test case design technique	:	Decision Table Testing
Explanation	:	Determine and evaluate varied groupings of inputs and system actions, such as processing invoice thresholds and checking automated category changes with both correct and incorrect data inputs depending on system logic.

Test Case ID	TS01-TC04
Test Case Name	System must be able to categorize customer based on number of sales
Pre-Conditions	1. Customer already exists
Test Procedures	1. Click the Customer modules 2. View the table displayed
Test Input	Expected Output
Sales count > threshold	Customer category updated automatically

Table 4: Test Case for Categorizing Customers by Sales Volume

2.1.5. [FR-105] Update customer details.

Test case design technique	:	Decision Table Testing
Explanation	:	Determine and evaluate varied groupings of inputs and system actions, such as modifying current contact profiles or handling empty mandatory fields on existing records with both correct and incorrect data inputs depending on system logic.

Test Case ID	TS01-TC05
Test Case Name	Update existing customer details
Pre-Conditions	1. Customer already exists 2. User must be on the Customer module
Test Procedures	1. Click customer's name 2. Click "Update" button 3. Update customer's details 4. Click the "Save" button 5. Customer's detail updated
Test Input	Expected Output
Change phone number	Updated successfully
Empty required field	Validation error shown

Table 5: Test Case for Update Customer Details

2.2 [FR-300] User must be able to manage supplier.

The Supplier Management Module in the 'DobiDemo' system enables users to handle vendor profiles, ensuring smooth coordination of provider-based operations. This component is essential for registering new vendors, checking entries, modifying records, and keeping supplier profiles accurate while monitoring related business expenditures and outstanding balances.

1. Test Scenario [TS03]: Concentrates on verifying the administrator's capacity to execute core supplier administration features.
2. Test Cases [TC01 to TC04]: Verify the individual capabilities of the Supplier Management Module, such as creating new supplier profiles, browsing the vendor registry, searching for specific firms, reviewing detailed company files, and editing current supplier information.

2.2.1. [FR-301] Add new supplier.

Test case design technique	:	Equivalence Partitioning + Boundary Value Analysis
Explanation	:	Equivalence Partitioning divides the input data into valid and invalid partitions, such as non-empty strings vs. empty strings for names, or numeric phone strings vs. alphanumeric strings. Boundary Value Analysis tests the edges of these partitions, such as verifying mandatory fields are not empty.

Test Case ID	TS03-TC01
Test Case Name	Add valid supplier with complete information
Pre-Conditions	1. The user is logged into DobiDemo system. 2. The user is on the Supplier Management module page.
Test Procedures	1. Click on the "+New" button. 2. Enter a valid name, a valid numeric phone number, and text description. 3. Enter a valid initial numeric amount into the Starting Balance field.

	4. Click the "Save / Submit" button.
Test Input	Expected Output
Name: "UMT Supply" Phone: "0123456789" Description: "Primary electronics vendor" Starting Balance:150	Supplier successfully added. The system saves the record and redirects or displays a success confirmation message.
Phone: "ABCD1234"	System shows a validation error message indicating that the phone number format is invalid.
Name: "" (Empty)	System rejects input.

Table 6: Test Case for Add New Supplier

2.2.2. [FR-302] View and sort list of suppliers.

Test case design technique	:	Use Case Testing + Equivalence Partitioning
Explanation	:	Use Case Testing ensures the system handles standard navigation flows like viewing and sorting existing lists properly. Equivalence Partitioning evaluates search queries by dividing inputs into valid records that exist in the system database and invalid records that do not.

Test Case ID	TS03-TC02
Test Case Name	Sort supplier list by name
Pre-Conditions	1. User is logged into DobiDemo system. 2. User already on supplier module.
Test Procedures	
Test Input	Expected Output
Sort: A-Z	Supplier list sorted correctly in alphabetical order.
Keyword: Unknown	System shows "No supplier found" message on the interface.

Table 7: Test Case for View and Sort List of Suppliers

2.2.3. [FR-303] View supplier details and related expenses.

Test case design technique	:	Use Case Testing
Explanation	:	Validates that clicking an item successfully fetches and populates the detailed view with its corresponding attributes and history records as expected by an end user.

Test Case ID	TS03-TC03
Test Case Name	View supplier details and related expense transaction history.
Pre-Conditions	1. User is logged into DobiDemo system. 2. User is on supplier module.
Test Procedures	1. Click on supplier name on supplier module. 2. View the details of the supplier.
Test Input	Expected Output
Supplier ID: 1	Supplier details and transaction history displayed correctly on the detail view panel.

Table 8: Test Case for View Supplier Details and Related Expenses

2.2.4. [FR-304] Update existing supplier details.

Test case design technique	:	Use Case Testing + Equivalence Partitioning
Explanation	:	Use Case Testing handles the workflow sequence of modifying an active form state. Equivalence Partitioning separates valid input adjustments from empty or illegal values during modifications.

Test Case ID	TS03-TC04
Test Case Name	Update supplier details with valid data amendments.
Pre-Conditions	1. User logged into DobiDemo system. 2. User is on supplier module.
Test Procedures	1. Click “edit”. 2. Modify the information with updated data. 3. Click “save”.
Test Input	Expected Output
Supplier ID: 1 Name: Dobi Detergent Sdn Bhd Phone: 0142345674 Description: updated supplier info Current Account Balance: 50	Updated details are saved successfully and displayed on the interface.
Name: null	System rejects updates. Input is not recorded in the supplier list, and validation errors are displayed next to the problematic input fields.

Table 9: Test Case for Update Existing Supplier Details

2.3. [FR-500] User must be able to manage product

The Product Management Module in the 'DobiDemo' system enables users to manage product information, ensuring efficient handling of inventory-related tasks. This module is critical for adding, viewing, updating, and maintaining product data while tracking associated stock levels, units, and pricing structures.

1. **Test Scenario [TS05]:** Focuses on the overall ability of the user to manage product-related functionalities.
2. **Test Cases [TC05 to TC08]:** Validate the specific features within the Product Management Module, including adding new products, viewing and searching the product catalog, viewing detailed product descriptions, and updating existing product prices or units.

2.3.1 [FR-501] Add new products with name, measurement unit and unit price.

Test case design technique	:	Equivalence Partitioning
Explanation	:	Inputs are divided into valid and invalid equivalence classes for product name, measurement unit, and unit price to verify that the system accepts valid data and rejects invalid data.

Test Case ID	T505-TC01
Test Case Name	Add new products with name, measurement unit and unit price
Pre-Conditions	1. User is logged in with valid Owner credentials 2. User is on the "Add Product" form page.
Test Procedures	1. Navigate to the Product module. 2. Click the "+New" button. 3. Enter product name, measurement unit, and unit price(RM). 4. Click "Add". 5. Verify the system has updated the product list.
Test Input	Expected Output
Name: Detergent Powder Unit: kg Unit Price (RM): 4.00	Product is added successfully. Product details are displayed correctly in the product list.

Name: Fabric Softener Unit: bottle Unit Price (RM): 5.00	Product is added successfully. Product details are displayed correctly in the product list.
Name: null Unit: kg Unit Price (RM): 5.00	System displays a validation message “Product name is required”.
Name: Soap Unit: pcs Unit Price (RM): -3.00	System rejects invalid unit price input.

Table 10: Test Case for Add New Products with Name, Measurement Unit and Unit Price

2.3.2. [FR-502] View a list of products, sort them according to Name or price per unit and search for the product by name.

Test case design technique	:	Equivalence Partitioning
Explanation	:	Search inputs are divided into valid and invalid equivalence classes. Sorting functionality is tested using the available valid sorting options (Name and Price/Unit) to verify correct product ordering.

Test Case ID	T505-TC02
Test Case Name	View a list of products, sort them according to Name or price per unit and search for the product by name
Pre-Conditions	1. User is logged in with valid Owner credentials 2. User is on the "Add Product" form page.
Test Procedures	1.Observe the default loading state of the products list view. 2.Click “↑↓” next to the Name column header. 3.Click “↑↓” next to the Price/Unit column header. 4.Click the Search text box on the right side and type a search keyword.
Test Input	Expected Output
Search: A	Products with names containing or starting with "A" are displayed.
Search: Z	Products with names containing or starting with "Z" are displayed.
Sort: Name	Products are displayed in alphabetical order by product name (A–Z).
Sort: Price/Unit	Products displayed in ascending/descending order

Table 11: Test Case for View Products and Sort Accordingly

2.3.3. [FR-503] View product details.

Test case design technique	:	Equivalence Partitioning
Explanation	:	The product selection is divided into valid and invalid equivalence classes. A valid product ID/selection should display product details, while an invalid or non-existent product selection should return an error message or no result.

Test Case ID	T505-TC03
Test Case Name	View product details
Pre-Conditions	1. User is logged in with valid Owner credentials 2. User is on the "Add Product" form page. 2. User is viewing the Product List table.
Test Procedures	1.Click on product name. 2.View product details in the Product Info page.
Test Input	Expected Output
Click on “Aqua DryClean”	List of products displayed correctly.

Table 12: Test Case for View Product Details

2.3.4. [FR-504] Update existing product details.

Test case design technique	:	Equivalence Partitioning
Explanation	:	Inputs for product name, measurement unit, and unit price are divided into valid and invalid equivalence classes. The system should successfully update products with valid data and reject updates with invalid or missing data.

Test Case ID	T505-TC04
Test Case Name	Update existing product details
Pre-Conditions	1. User is logged in with valid Owner credentials 2. User is on the "Add Product" form page. 2. User is viewing the Product List table.
Test Procedures	1.Click the “Update” button inside the Product Info. 2.Modify a field value (e.g., update the Name or Price/Unit value) 3.Click the “Save” button. 4.Click “Product” module on the left sidebar to return to the product list. 5.Type the updated product name into the Search bar to locate the modified product info.
Test Input	Expected Output
Change Price from RM4.00 to RM7.00	The system successfully updates and displays the new product details.
Change Unit from "kg" to "liter"	The modified item specifications are successfully saved and displayed.
Update Price from RM4.00 to -5.00	The system blocks the negative amount and denies the invalid entry.

Update Product Name to null	The system blocks the empty submission and triggers an alert stating, "Product names are required".
-----------------------------	---
